## Disclaimer

The information presented herein represents the views of the author as of the date of publication and is for informational purposes only.

Third party services like twitter, socialloomph, their web page structures and API affects the performance of TweetAttacks. Changes of their services might cause TweetAttacks to not work properly on some of its features. We have no control over the changes they will make in their services. Because of this we cannot make any guarantees that all of the features available now will continue to function as it is but your license have access to our lifetime updates and you can get any changes we make to the program for free.

By buying\installing TweetAttacks you agree that you comply with our license agreement. <http://tweetattacks.com/license-agreement.html>. Additionally, by using TweetAttacks, you agree to indemnify and hold harmless TweetAttacks and the creators from any problems resulting from your use of it. We recommend that you use the software judiciously and not abuse it for the purpose of spamming those services. Doing so will most likely result in your accounts being terminated, in effect wasting any effort you've put into it.

TweetAttacks don't promote spam. This tool was created for you to market your product effectively with less effort. Please use it well and provide value to our fellow tweeters.

## Introduction

Twitter is been around for years and yet still rapidly growing. Last April 2010 it reached 105,000,000 in population, that's about a third of the US population and about 25% of Facebook's population. They are getting 300,000 average new users every single day.

Each of every one of them has their needs and wants that waiting to be fulfilled. There overflowing prospects in twitter. Many are already making a killing and most are not. Why? Because most probably they are doing it the wrong way and they are all doing the same thing.

Twitter is very simple and straight forward. Many think that twitter is no longer effective for marketing. Well, 105 million of users thats impossible, if you can get traffic from a source then I cannot think of any reason why it should not work.

Whether you are a blogger, autoblogger, list builder, or just an individual promoting your offline business or other businesses, twitter is for you.

Based on our more than one year of experience in Twitter marketing, making a killing in twitter is very simple. You just need to equip yourself with the right knowledge, taking the right action and automating the process with the right tools. By taking action by buying TweetAttacks and taking another action reading this report, you will get a better understanding on how to succeed in twitter.

Not just us, but many TweetAttacks customers are earning 3-5 figures a day using TweetAttacks, they are using different methods of course but we detailed here the easiest methods we can think off including the method that made our beta testers earn at least \$100 during their testing period. We can never guarantee that you will make the same of course because the result will differ on the amount of effort exerted.

TweetAttacks is still a tool, and how good or bad it is still depends on the one who is using it. Like Leonardo da Vinci did not become great artists because he has the best paint brush in the world. I'm sure you know what I mean. But we are confident to say that the tool you are holding on now is the best twitter marketing software available in the market today.

This ebook will show you how we did it and we hope that the next twitter success story we will going to hear next will be coming from you.

## Part 1: Getting to Know Your Tool

As you already know, TweetAttacks was built with many features that you cannot find in any other Twitter Marketing Software out there. In this section, we will introduce those features and go through them one by one.

**Please read this eBook before jumping to the monetization guides.**

## System Requirements

1. Windows Operating System
2. Microsoft .Net Framework 3.5 SP1 or above
3. Microsoft Internet Explorer 8

If you are on a Mac or Lynux, you need to run windows virtualization software in your machine and we highly recommend the free VMWare player or VirtualBox.

## Installation and Updates

The zip file contains 2 files namely Setup.exe and Setup.msi

To install your application, just double click and install any of those files and follow the installation instructions. This will also install Microsoft .net 3.5 Service Pack1 if it is not yet installed in your machine.

You will be automatically notified when a new update is available.

If you lose your installation files for some reason, you can always get it here

<http://tweetattacks.com/dl/setup.zip>

If you forgot your registration key, you can retrieve it using this form

<http://tweetattacks.com/resend.php>

If you want to transfer your license to different computer, see

<http://tweetattacks.com/support/knowledgebase.php?article=18>

## **TweetAttacks Modules Overview**

In this part of the manual we will have a quick overview of all the modules included in TweetAttacks.

### **1. Follow\Unfollow Module**

This module will allow you to follow other users and unfollow those users who did not follow you back after period of time.

### **2. Direct Messaging**

You can use this module if you want to send direct messages to your followers. You can use it to greet them, thank them for following you or to send your offers.

### **3. Tweet Scraper**

This module contains a web browser which you can use to browse any website, blog, quote website and TweetAttacks can grab contents on those web pages and convert them into Tweets. This module alone can save you huge amount of time, typing tweets about your niche, you can use this to open your website and TA will convert your websites content into tweets automatically.

### **4. Tweet Scraper Advanced**

This module works similarly with Tweet Scraper, the major difference is that, this module is 100% set and forget. You will just need to set up the website that you want to scrape and TA will go through all the inner pages of that website and get the contents and automatically convert them into tweets.

### **5. @Reply and @Mention Generator**

This is another module that you can use to generate Tweets but not just ordinary tweets. With this, you can generate tweets that will be visible to all twitter users and not just your followers. Since the tweets are visible to all users, this can give you thousands of traffic even if you don't have followers.

How is that possible? Lets say, if you are selling an ebook about ways to make money online, you can use this module to fetch all the twitter users that are tweeting about

*"I want to make money online" or "I want to earn from home" or "I want to earn money" etc*

And use this module to generate @reply to their messages, and if your reply contains the link to your offer. BAM! That's instant **very targeted traffic**.

This module can also generate @mention messages to any user, and one of the best ways to find massive list of prospects is through someone else's followers. In our example, if you are selling internet marketing products, you can find popular people in the internet marketing arena or other related, like problogger, its twitter profile have 100,000 followers. Using this module, you can generate @mention messages to those 100,000 users and send them your offer. They can see your tweets even if they are not your followers.

More of this later but I am sure you already realize the potential!

## 6. **Tweet Manager**

Having thousands of tweets from **Tweet Scraper** and **@Reply Generator** can be a pain if you don't have tools to manage them easily. That is the main purpose of this module, it will allow you to manage thousands of tweets like sorting, replacing unwanted words, removing duplicates, putting your links, generating schedules and many more.

You can also use this module to send your tweets to socialoomph or post from web using one selected account.

This module simply prepares the tweets before posting in **Tweet Poster** module.

## 7. **Tweet Poster**

This is the actual module that handles the posting of tweets generated from **Tweet Scraper** and **@Reply Generator** and this is also the one who will read and execute your generated schedules in **Tweet Manager**. Basically **Tweet Scraper** and **@Reply Generator** only generate tweets, and **Tweet Manager** can manage and create schedules for those Tweets but **Tweet Poster** is the one sending those tweets to Twitter. This module can send tweets using many accounts, as many accounts as your computer can handle.

## 8. **Wait & Reply**

This module can also generate and post @replies to users who are tweeting about something that you offer, the major difference is that, this module will work on the **future tweets** that are not been posted yet.

In our example above, if you have internet marketing ebook, **@Reply Generator** generates reply to the tweets that contains "*how to make money online*" and send your offer using **Tweet Poster**, but what about the tweets that are not posted yet? You don't need to run **@Reply Generator** again to get them, just use this module and it will wait

for someone to tweet *“how to make money online”* and generate @reply, and send that reply immediately. It will run and do that for you 24\7, no user intervention.

## 9. ReTweet Attacks

You can use **Follow\Unfollow Module** to build followers in many accounts, but those accounts will be useless if you cannot send offers to their followers. Of course you can use **Tweet Poster** and let all those accounts post your link. But there is a much better way.

In my years of experience in twitter, **@Retweets** can get more click rates than just tweeting links. Why? Im not really sure about the psychological side of it but, **it is very common for people to tweet their own links** and people already learned to ignore it. If there is an **RT** to it, it is imposing that the user is recommending it and if someone is recommending it, people have perception that it is really something good or important.

That **RT**, only 2 letters but it means a lot, it acts as your **social proof** and people normally want a proof before believing into something.

This module can do that, with this module, you can use hundreds or thousands of your accounts to tweet your link.

It can definitely boost your account and website popularity. There are so many other benefits to this because twitter is putting so much importance on retweets. Here are some other benefits that you can get.

1. You will get hundreds of backlinks from authority websites that are monitoring and displaying popular tweets in twitter that have many retweets.
2. Your tweet will be the first one to show when people search for tweets that are related to yours.
3. If you put #hashtags and with enough number of Tweets, you can definitely dominate the trending topics maybe not the global, you will need million to do that, but you can dominate local trending topics.

## 10. Account Statistics

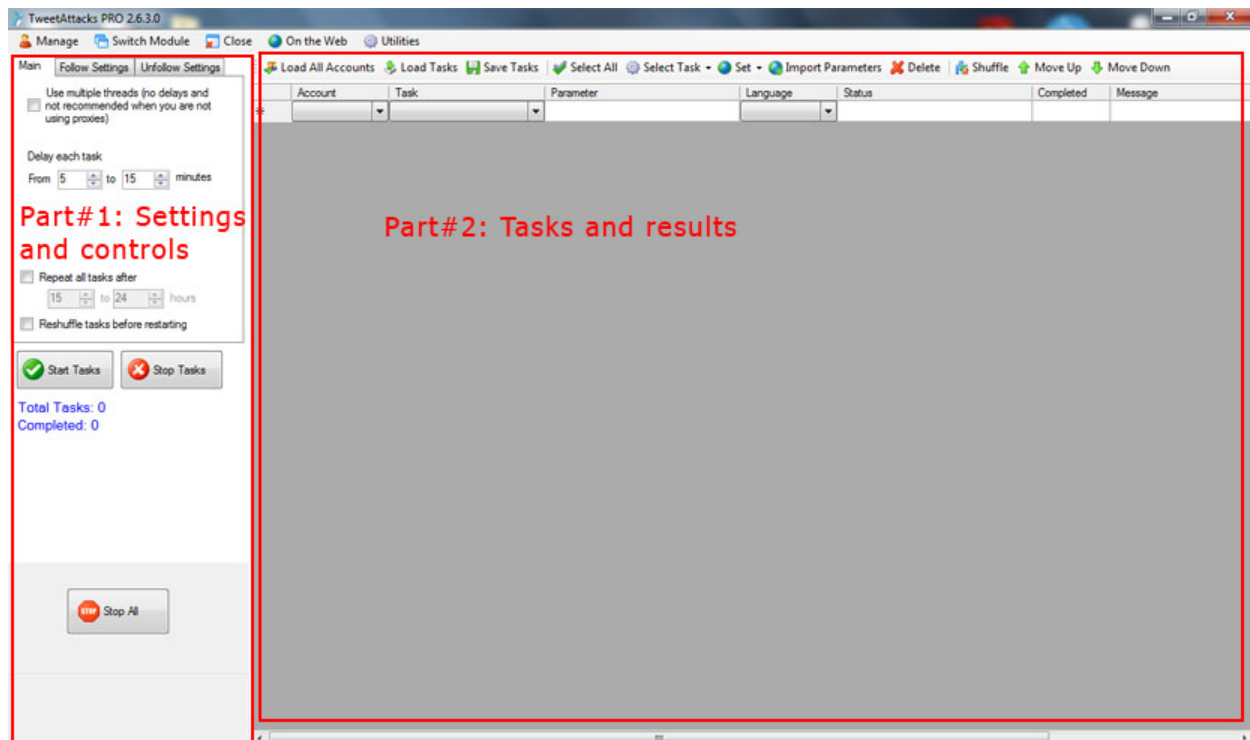

In the previous modules, we provided ways to build many accounts and checking those accounts manually is a real pain. You can use this module to do that, you can check your accounts following and follower's growth, how many posted tweets, if it is suspended and other info.

**Important Note:** As you can see there are so many features that you can use and **you don't need to use them all in order to succeed in twitter**. Some only use the Follow\Unfollow and Tweet Poster Modules, and some only use the Wait and Reply, some only use Follow Unfollow + Retweet Attacks. It really depends on your needs. Many customers think that they need to use them all but it's not, it's not the

tool the will make you successful but how you will going to use it. Tools like TweetAttacks can only help you to speed up the process.

## TweetAttacks Module Parts

In the previous part we discussed about the different modules in TweetAttacks. Each of those modules have 2 parts. Like the screenshot below, (Follow\Unfollow Module).

**Settings and Controls (left side of the screen)** The first part of every TweetAttacks module contains the settings on how TweetAttacks will execute the tasks, and each module have each own settings and configurations. This screen also have the controls when you want to start or stop the tasks. The settings you put here will be saved automatically and loaded automatically so its rare that you will change the things here. Most of the time, you will just need to click the start and stop buttons to execute and stop the tasks.

**Tasks and Results (right side of the screen)** This part of the screen contains the tasks that will be executed. If you notice, this part have their own toolbar which you can use to manage the tasks easily. It also contains a big table where you will enter the tasks and the tasks will be entered per row. If you want TA to execute 3 tasks, you will need to define 3 tasks in this section by adding 3 rows in that table. Like if you have 3 accounts and you want TA to auto follow using those 3 accounts, you will need to enter them in that table and select the accounts, the task types, and parameters.

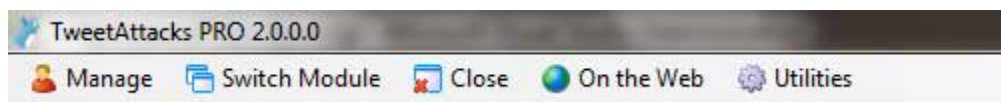

After that you are ready to execute the tasks, and you can execute them using the Start buttons. After pushing the start button, TA will execute the tasks according to the settings that you input in the left side of the screen.

Its the same in all modules, they are just different settings and different column that you need to fill to create the tasks but we will discuss each later in this report.

And now you are familiar with the features of TweetAttacks, in the next part of this manual, we will talk about the features in more details.

## TweetAttacks Main Menu

TweetAttacks main menu have only 5 items

**Manage.** This button contains the account management features and settings.

**Switch Modules.** Use switch modules to switch between TweetAttacks modules eg:. Follow\Unfollow, Direct Messaging, Tweet Scraper, Reply Generator, Tweet Manager, Tweet Poster, Wait & Reply, @Reply Generator and ReTweet Attacks.

All new modules that will be added in the future will be added here.

**Close.** Use this button to close the application.

**On the Web.** We will be putting here the things that we want you to check out like links and other useful resources.

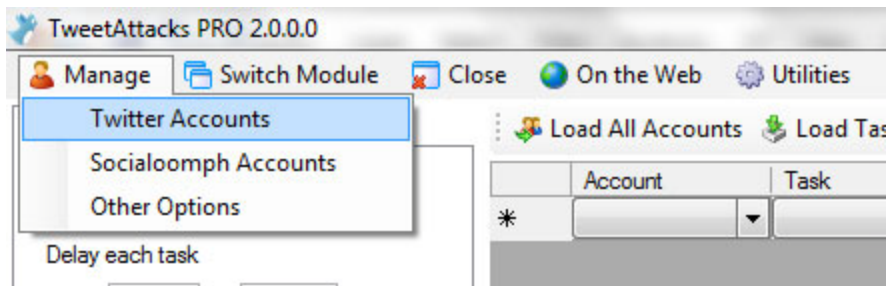

**Utilities** This contains some utilities that you might use very rarely. You might find the uses of some of the items later in this manual.

## Account Management

### Adding Twitter Accounts

Before using this application, you must first add your twitter accounts. You can add your twitter accounts by doing the following.

1. Go to **Manage->Twitter Accounts**

2. Twitter accounts form will appear.

	Username (not email)	Password	Proxy	Socialloomph Account	VIP Lists
*					

Fill up the information then click Save

**Username.** This is your twitter account username. In this column, you should input your twitter accounts username\screenname and not the email address to avoid problems.

**Password.** Your twitter account password

**Proxy.** Proxies are not required and you can use TweetAttacks with or without proxies. However if you want to do twitter marketing in a more aggressive way, like using more than 5 twitter accounts at the same time. We highly recommend that you invest in proxies.

If you are new to proxies, basically, it is an alternative to your IP address. If you are not using proxies and you are using many twitter accounts, twitter will know that all those accounts are coming from the same computer because they will all use your computers IP address. And that might result to your accounts getting suspended. We will need proxies so that your accounts will use different IP addresses and will appear to twitter that they are coming from different computers.

If you want to use a proxy, you should input it in **IP:Port** format or if your proxy provider requires authentication you should specify it as **IP:Port:Username:Password** format.

If you intend to use proxies, we dont recommend using free public proxies because they are normally associated with spam activities and many other marketers are using them and might get your accounts into trouble.

For proxies, any exclusive **HTTP** proxies should work fine. We are using proxies form different providers but you can settle to one provider only.

We recommend exclusive proxies from [this provider](#).

**Socialloomph Account.** TweetAttacks have tweet scheduling feature already so you might want to skip this one. This is not required and you can leave it blank, use this only if you want to use socialloomph services. For more information about socialloomph, please see <http://socialloomph.com/>

**Note:** Your twitter account should be added in your socialloomph account in order to schedule tweets using the selected socialloomph account.

**Edit VIP list** – VIP list are the users that you don't want to be unfollowed even if they don't follow you back. For example, if you added the twitter account of problogger but he does not following you back and you still want to receive updates from him, just add his username in the VIP list.

### **Followed List**

This is the list where TA saved the names of the users that you followed so it can ignore them the next time it follows. By default, TA use different list for every user which can result for your accounts to follow the same people.

Example:

If you have accounts named accountA, accountB and accountC,

By default, all those 3 accounts have separate followed lists, so they might end up following the same people. If accountA followed userA, there is a possibility that accountB and accountC will also follow userA because it is not yet included in their list.

If you want accountB and accountC not to follow the users followed by accountA, you should set the same followed list to those accounts.

If accountB and accountC already built their list, and you want to merge their followed lists into 1 list, select your accounts and use the **Set and Merge->Followed List** button.

### **Replied List**

This is the list where TA is saving the users that the account sent @messages to.

The same with followed list, they might end up sending @reply messages to the same people if they have different replied list, so you need to select the accounts and use **Set and Merge->Replied List** if you want your accounts to not @reply the same people.

### **VIP List**

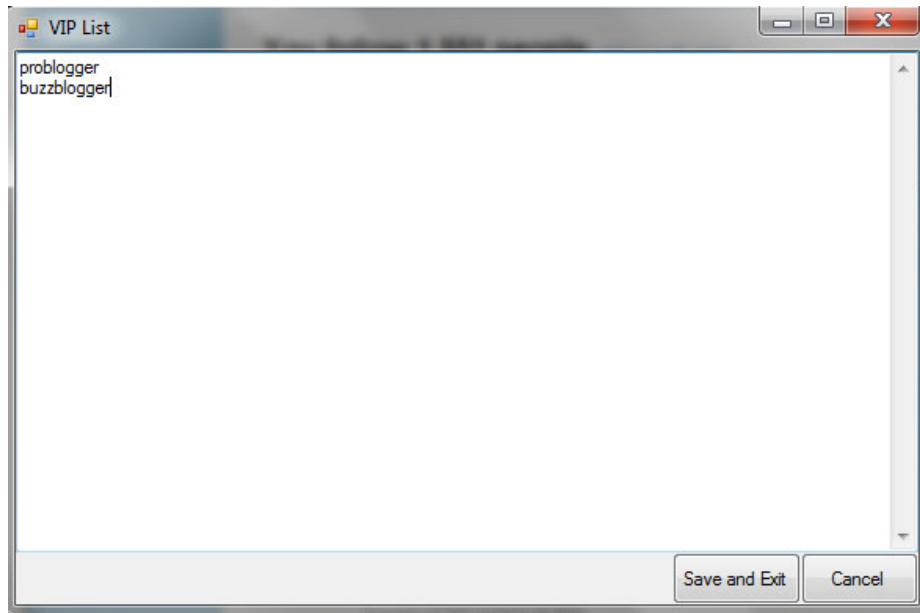

VIP List is the list of users that you don't want to unfollow even if they are not following you back. This is useful when you are watching tweets of some gurus and you don't want to unfollow them even if they are not included in your followers.

The same in the VIP list, if you want to use only one VIP list, you can select all your accounts and use **Set and Merge->VIP List** button to merge it.

## How to Add Users in the VIP List?

To add users in the VIP list

1. Click **Edit VIP list** button
2. The edit **VIP list** form will appear

3. Enter the twitter username of the people you don't want to unfollow, one name per line as shown in the screenshot above.

**Note:** Usernames are case sensitive, it means that **UserName is not the same as username**, so if the username of the account that you want to add have capital letters, you should input it with capital letters eg: **UserName** and not **username**.

4. Click save

## How to Import Accounts from Text File?

If you have existing text file that contains your twitter accounts, you can import them in tweetattacks using the import button in Twitter Accounts form.

**Import Delimiter.** The import delimiter is the field separator in your text file

Eg: If you have this format in your text file

Username|password

The delimiter will be “|” (without quotes)

If you have this format

Username,password

The delimiter will be “,” (without quotes)

To start importing you accounts,

1. Click **Import Accounts** button and open your text file.
2. Browser and open your text file
3. Click save

## How to Import And Automatically Assign Proxies to Twitter Accounts?

If you have a list of proxies in a text file, you can automatically import it using the import proxies button.

The text file should be in the following format

IP:PORT:username:password

IP:PORT:username:password

One proxy per line..

If your proxies does not require username and password, just remove them and input your proxies in this format

IP:PORT

IP:PORT

and so on

## Follow\Unfollow Module

The best way to increase your followers is to follow them first. It’s still one of the most effective ways to build targeted followers\prospects and to build authority in your chosen niche. If you have a lot of followers, your account will look like authoritative on that niche and you have a list of prospects where you will send your offers or links.

The key here is to build a much targeted list by following very targeted people. You can either

1. **Follow people that are talking about your niche**, for example if you are promoting weight loss products or blog, you might to follow people talking about “I want to lose weight”, “How to reduce weight?” etc. This is to make sure that you are following the right people, people that are really interested in your offers.
2. **Follow followers of superstars or authorities in your niche**. For example, if you are in the blogging or make money online niche, you might want to follow the followers of problogger, which is one of the most popular bloggers around. By following his followers, they will notice you immediately and there is a high chance that they will follow you back since they will learn that you are in the same niche or you are offering products and services that they might need.

TweetAttacks can handle this for you 24\7. This alone will cost you more than 100 bucks if you choose other tools.

TweetAttacks was made and designed to handle multiple accounts at a time to increase your productivity even more and of course to increase the results you can get. If you have 100 accounts and each of them have at least 1000 followers (which you can easily achieve in few days), it means that you already have 100,000 prospects.

We recommend that you use multiple accounts for faster results rather than building only one account because twitter have limitations and it allow single account to follow 1000 people a day. By using around 100 accounts, you can follow up to 100,000 people a day.

Note: The daily limit is not always 1000 per account; there is a math behind it which will be explained later in this report.

The Follow\Unfollow module has the following settings which was separated in 3 tabs. First is the main settings which handling how TA handle all the tasks, the 2<sup>nd</sup> is the Follow Settings which defines how TA will handle all the follow tasks and lastly, we have the unfollow settings which defines how TA will handle all the unfollow related tasks.

Main
Follow Settings
Unfollow Settings

☐ Use multiple threads (no delays and not recommended when you are not using proxies)

Delay each task  
From 5 to 15 minutes

☐ Repeat all tasks after  
15 to 24 hours

☐ Reshuffle tasks before restarting

Start Tasks

Stop Tasks

Total Tasks: 0  
Completed: 0

Main
Follow Settings
Unfollow Settings

Auto Follow Settings
☒ Dont follow users that followed before  
☒ Dont follow users with no picture  
☒ Dont follow users with links on latest searched tweet  
☐ Shuffle list when following from .txt file  
☐ Use maximum limit

Limit from 50 to 150  
Delay from 1 to 5 seconds

Start Tasks

Stop Tasks

Total Tasks: 0  
Completed: 0

Main
Follow Settings
Unfollow Settings

Auto Unfollow Settings
☒ Protect mutual followers  
☒ Dont unfollow users in VIP list

Unfollow users followed at least 2 days ago

☐ Use maximum limit  
☐ Limit by percentage of total following count

Limit from 50 to 150  
Delay from 1 to 5 seconds

Start Tasks

Stop Tasks

Total Tasks: 0  
Completed: 0

## Main

- **Use multiple threads (no delays).** Check these options if you want TweetAttacks do multiple tasks at a time.

For example, if you have Account A, Account B and Account C and you want to TweetAttacks to follow using those accounts at the same time, just check this option and put 3 in the threads box. This will save you tons of hours, you can use this option to run even hundreds of accounts at a time or as many as your computer and internet connection can handle.

On the other hand, if you want Account A to finish first before starting on Account B. Just leave this option unchecked.

**Note:** Only use and check this option if you are using proxies, so twitter will not know that you are using many accounts at the same time through your IP address. For best proxies to be used in TweetAttacks, please always refer to this knowledgebase article that we update regularly <http://tweetattacks.com/support/knowledgebase.php?article=10>

- **Delay each task.** This option is only available if the first one was unchecked. This will set the interval between executing the next task in the list. If you put 5 to 15 minutes, TA will randomly select between 5 to 15 minutes, for example, if it selected 6 minutes, it will execute the next tasks in the list, **6 minutes after** the first one have been completed.

- **Repeat all tasks.** Use this option if you want TweetAttacks to repeat all the tasks after certain number of hours. This will allow you to let TweetAttacks work on your accounts 24\7 without setting it up over and over.

For example, if you input 20-24 hours, after executing all the tasks in the list, it will automatically wait for 20-24 hours then execute all the tasks again. It will keep on doing this as long as TweetAttacks is open. You can find more offers and you can create more products while TweetAttacks is building followers for you. If you don't want your computer to be always on, you might want to install tweetattacks in a VPS so you are running TweetAttacks elsewhere, for best VPS that support TweetAttacks please see this knowledgebase article

<http://tweetattacks.com/support/knowledgebase.php?article=23>

- **Reshuffle tasks before restarting.** If you chose to automatically restart the tasks, check this option if you want TweetAttacks to change the ordering of the tasks before executing them because executing same accounts over and over at the same order might raise a red flag to twitter so we recommend checking this every time you enable **Repeat all task** option.

## Follow Settings

- **Dont follow users that followed before.** TweetAttacks records and remembers users that are previously followed. Check this option to not follow the users that you already followed before. This is very useful because if you keep following the same people over and over again, they might report you for spam activities.

**Note:** TweetAttacks can only remember the people you followed using it and it cannot remember the users you followed manually or using different software.

- **Dont follow users with no picture.** Based on my experience, most of those users who don't have picture are bots and spammers. Check this option to ignore them. This will help you get real people in your followers list.
- **Dont follow users with links on latest\searched tweet.** Many spammers and bots only tweet links. This option will allow you to ignore users that contains links in their latest tweet if you are following from a list of other followers. This will also ignore users with links on their tweets when you are following users which appeared in your search result.
- **Shuffle list when following from a .txt file.** If you are following from a .txt file, checking this option will let TA shuffle\randomize the list of users in the .txt file before it starts following. This

is important if you have a list of usernames to follow and you want many of your accounts to use the same list.

- **Limit.** Select a number of users to follow\unfollow to avoid getting suspended. You can check **Use Maximum Limit** if you want TA to stop only if it already reached twitters following limit or when it reach the end of the search result list if you are following from search result or the last page of other users followers list.

For example, if you input 50 to 150 in the **Limit from x to x**, it will randomly select a number from 50 to 150, like 80 and it will automatically stop following when it already followed 80 users. The number of users it already followed will be displayed in the **Completed** column, in the right side of the screen. It will display as 0\80, it means that it followed no users yet and 80 more to go, as it is following, the first number increases.

**Important Note:** The 80 in the completed column is the number randomly generated from the setting you input in **Limit from x to x**, it is not the total search result from twitter and it is not always mean that it will stop only if it reaches that number. Sometimes it will never reach that number because of your other settings like, ignore users with no picture etc. It will stop following, whenever it cannot find any more users to follow based on your settings or if it already reached the last page of the search results or if it reaches the last page of other users' followers.

- **Delay.** Set the delay between follow requests (in seconds). Delays will be randomly generated between those 2 numbers on each request for a more random behaviour.

## Unfollow Settings

- **Protect Mutual Followers.** Check this option if you want TweetAttacks to check the user if it is following you back, if this option is checked and the user is following you back, the user will be ignored and TweetAttacks will move to the next user in your followers list.
- **Dont Unfollow Users in VIP List.** In twitter account manager, every account have their own VIP lists and you can use this option if you want to ignore them when unfollowing or not.
- **Unfollow users followed at least.** Twitter spam bots checks the date when you followed and unfollowed users. Make sure that you will wait few days before you unfollow the users you followed to avoid getting banned. Use this option to specify the number of days. As the time of this writing, the time to unfollow them is 2 days after you follow them. In that case, you should put 2 in that setting.

- **Limit.** Select a number of users to unfollow to avoid getting suspended. You can check **Use Maximum Limit** if you want TA to stop only if it already reached twitters limit or when it reach the end of your accounts **following list**.

For example, if you input 50 to 150 in the **Limit from x to x**, it will randomly select a number from 50 to 150, like 80 and it will automatically stop unfollowing when it already unfollowed 80 users.

The number of users it already unfollowed will be displayed in the **Completed** column, in the right side of the screen. It will display as 0\80, it means that it unfollowed no users yet and 80 more to go, as it is unfollowing, the first number increases.

**Important Note:** The 80 in the completed column is the number randomly generated from the setting you input in **Limit from x to x**, it is not always mean that it will stop only if it reaches that number. Sometimes it will never reach that number because of your other settings like, only unfollow users followed at least x days ago etc. It will stop unfollowing, whenever it cannot find any more users to unfollow based on your settings or if it already reached the last page of your accounts following list.

- **Limit by percentage of total following count.** Check this option if you want to set the limit by percentage of your total following count. Example, if your account is following 1000 users. Setting it to unfollow 10 percent of that will result TA to unfollow 100 users. If your account is following 2000, it will unfollow 200.

This is very useful especially if you want to run TA 24\7 without setting up the exact number to unfollow over and over again. With this setting, it will always adjust the number of users to unfollow as your accounts number of following changes.

- **Delay.** Set the delay between follow requests (in seconds). Delays will be randomly generated between those 2 numbers on each request for a more random behaviour.

## Follow\Unfollow Module Toolbar

 Load All Accounts
  Load Tasks
  Save Tasks
  Select All
  Select Task
  Set
  Import Parameters
  Delete
  Shuffle
  Move Up
  Move Down

- **Load All Accounts**

This will load all of your twitter accounts and add into the tasks list so you don't need to add them all one by one.

- **Load Tasks**

Use this button to load saved tasks.

- **Save Tasks**

Use this button to save tasks in your hard drive so you can load and not add them manually again later.

- **Select All**

Use this button to select and highlight all tasks in the list.

- **Select Task**

Use this to assign tasks to all selected records.

- **Import Parameters**

Use this button to import parameters from a .txt file. The parameters should be entered one per line in a .txt and it fill the **Parameter** column in the tasks after importing.

- **Delete**

Use this button to delete the selected tasks.

- **Set**

Use this button to set certain column values for the **selected tasks** at once. This button will allow you to change certain column values for multiple tasks without entering them one by one.

- **Shuffle**

Use this button to randomize the ordering of the tasks before executing them. Just in case you want to reorder the tasks so that they will not be executed in the same order over and over again that may leave some traces.

- **Move Up\Move Down**

Use these buttons to change the order of execution of the selected tasks.

## How to Use Follow\Unfollow Module?

1. Switch to Follow\Unfollow Module.

2. Switch to settings and setup the desired settings for the tasks. You only need to set this up once and TweetAttacks will remember everything for you.
3. After selecting the desired settings, setup the tasks in the table located in the left side of your screen. The table looks like the screenshot below.

Account	Task	Parameter	Language	Status	Completed	Message
▼			Any Language ▼			

One table row means one task and you can add as many rows as you want and TweetAttacks will automatically execute them all for you.

### Creating Tasks

- **Account:** To create a task, just select the twitter account to use under the **Account** column
- **Task:** Then select what kind of task that you want to do with it, either
  - Follow other users followers  
Select this one if you want to follow the list of followers of a certain user. You can normally use this to follow the followers of a certain guru or authority in your niche to make sure that your account is connecting to the right people, people that really interested in your topic\offer.
  - Follow other users following  
Select this one if you want to follow following list of a certain user. This is a good way to make sure that you are targeting real humans, if you follow the users followed by certain guru or authority in your niche; it's a high chance that they are real people.
  - Follow from a .txt file  
If you have a list of usernames, you can use this option to let TweetAttacks to follow the list of people in the list.
  - Follow from search result  
Select this option if you want to follow people who are talking about certain keywords. This will make your marketing effort more targeted by making sure that you only follow people with the same interest.

- Follow from a list

Select this option if you want to follow people from other users lists. If you selected this task, you will need to input the target list in the parameter in this format **usernameofowner/listname**.

- **Unfollow**

Use this option to unfollow and cleanup the accounts following list.

When building followers by following and unfollowing, it is very important that you cleanup your following list by unfollowing people who are not following you back, this method will give you more space to follow more people.

Twitter only allow you to have certain number of following and that number will increase as your number of follower increases.

- **Parameter:** After selecting the task, you need to specify the **Parameter**

- The value you put in this column depends on the value selected in task, if you selected the task *Follow other users followers* or *Follow other users following*, you need to specify the username of the user that you want to follow his\her following\follower list.

Eg: If you want to follow the following or followers of the twitter account billgates, then just input the twitter username **billgates** in the parameter column.

- If you selected the task *Follow from a list (.txt file)*, you will need to specify the path where you saved the text file that contains the list of usernames that you want to follow.

**Note:** You can use the **Set->File** button if you want to set the same files for the selected accounts.

- If you selected the task *Follow from search result*, you just need to enter your search keyword in the Parameter column.

TweetAttacks will use <http://search.twitter.com/advanced/> to search for your keyword and follow the people in the search results. You can put anything here and you can also use twitter search operators <http://search.twitter.com/operators> for more advance and targeted search.

- If you selected the task *Follow from list*, you will need to enter the twitter username of the one who created the list and the exact name of the list in this format *username/listname*

Here is an example of a list created by problogger

<http://twitter.com/#!/probblogger/tech/>

That is the url of a list created by the user *probblogger* and the name of the list is *tech*. It is a list of people who are tweeting about techs. If you are in that niche, following those people is good because they are really targeted prospects.

To follow them, just enter *probblogger/tech* in the parameter column.

- If you selected the task *Unfollow*, you will not need to put anything in the parameter list because TweetAttacks will know that you need to unfollow the following list of the selected account in the account column.

**Note:** You can use the button **Set->Parameters** if you want to set the same parameters to the selected accounts. You can also use the **Import Parameters** button to get a list of parameters from a text file.

You can also use the load all accounts button to load all of your accounts in the tasks list. You can then select all or select few records then use the Set Task button to set task to all selected records at once.

- **Language:** This will let you select and filter people who only talks\tweets using a certain language.

**Note:** this option is not available when you selected the task *Unfollow* or *Follow from a list (.txt file)*

4. After completing the task list, set the delay before each task will be executed
5. You can check the option **Repeat All Tasks after** if you want TweetAttacks to automatically rerun all the tasks after the specified number of hours. This is very useful if you want to just leave TweetAttacks and your computer open and TweetAttacks will do the following and unfollowing for all of your accounts 24\7.
6. Click start to execute the tasks

## Notes on Following\Unfollowing

In every twitter account, you can only follow 2000 users if your number of followers is less than 2000. They implemented this to combat people who are following thousands with very less followers. With this rule, you are unable to follow more people if you are already following 2000 while your number of followers is less than 2000.

There are also cases that you already have very high number of following and very less number of followers. In this case, twitter and TweetAttacks will show a warning like

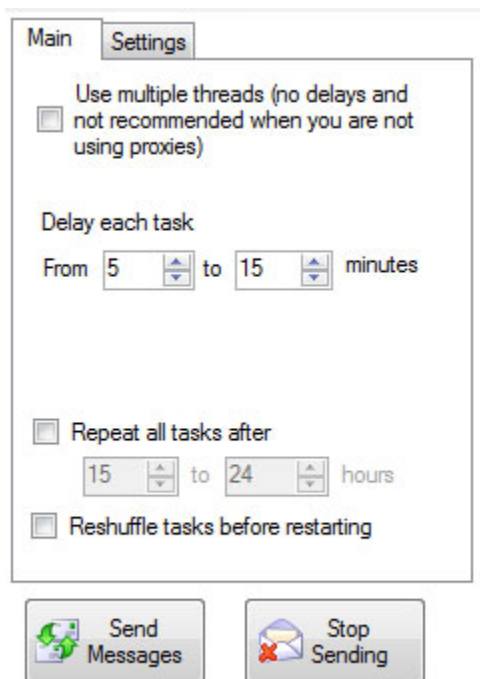

*“You cannot follow more people at this time” or “You reached the maximum follow limit”*

In order to follow some people again, you need to unfollow those users who are not following you back.

## Direct Messaging

This feature will let you send direct messages to your followers. Only to your followers because twitter will not allow people to send direct messages to users who are not included in their followers list. You can use this module to send thank you\welcome messages to your followers or about anything.

As you can see in the screenshot below, the settings is almost 100% identical to follow\unfollow module

The screenshot shows a 'Settings' window with the following options:

- ☐ Use maximum limit
- Limit from  to
- Delay between messages
- From  to  seconds
- ☐ Make links unique
- ☒ Ignore users who I sent messages before

The only different is the option **Ignore users who I sent messages before** and if you check this option, TA will ignore users you already sent message(s) to, this will be useful if you want TA to only send welcome messages to people who followed you back because you certainly don't want to send them welcome messages over and over again.

## How to Use Direct Messaging Feature?

1. After opening TA, go to Switch Module->Direct Messaging
2. The same with Follow\Unfollow module, you need to set the tasks, and one row means one tasks.
  - a. For every tasks you need to select first the **Account** that you want to use. Use the Load All Accounts button if you want to use all of your accounts.
  - b. Then use the **Load File** button to select the .txt file that contains your messages. Your file should be in the following format

Message1  
Message2  
Etc

One message per line and you can use {} spin syntax.

If you want to set the same messages file to all your accounts, just click **select all** to select all the accounts then click **Set Messages** button to select the file.

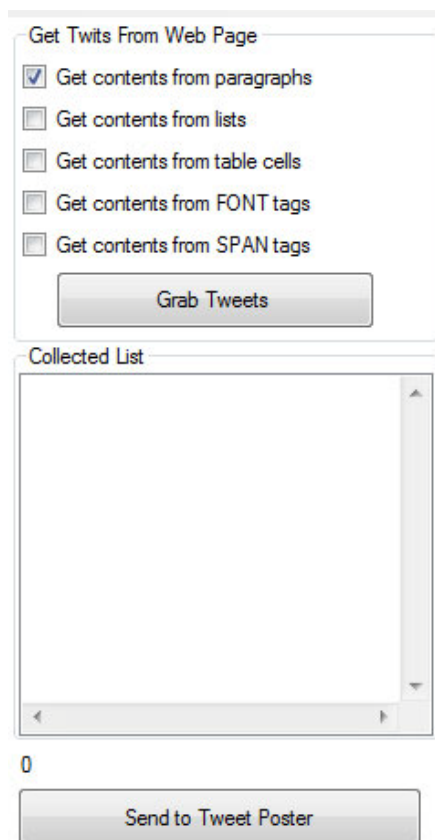

- c. After creating tasks, just click **Send Messages**

TA will go through your accounts followers and select message from the file randomly and send to the user. It will always start from the beginning of your list of followers. If you want to leave TA 24\7 and automatically send messages to your new followers, just check the **Repeat all tasks after** button.

## Tweet Scraper

Creating and writing tweets is a very time consuming task. I noticed that many bloggers that are using twitter, love to tweet quotes and other phrases from other websites and I do that myself. Copying and pasting 1 by 1 is very time consuming. Tweet scraper is designed to address that problem. Tweet scraper lets you grab phrases from any website of your choice and create tweets from it. It will automatically get phrases not more than 140 characters and those that not contain links. You can use this module to copy quotes and other phrases from any web page and send it to tweet poster for later posting.

Just use the browser on the right side of the window to go to any web page and click Grab Tweets.

The Tweet Scraper has the following options.

- **Get contents from paragraphs.** Check this option if you want TweetAttacks to read the paragraphs and attempt to create tweets from them.
- **Get contents from lists.** Read the lists in a selected web page and attempt to create tweets from them.
- **Get contents from table cells.** Read all the table cells (<td> tags) in a selected web page and get phrases.
- **Get contents from FONT tags.** Read phrases from html FONT tags.
- **Get contents from SPAN tags.** Read phrases from html SPAN tags.
- **Grab Tweets.** Click this button to start grabbing tweets from the selected web page.
- **Collected List.** Collected tweets from web pages will be listed here. You can double click any item to remove it from the list.
- **Delete** – use this button to delete the selected line in your list
- **Clear** – this button will delete all entries in the collected list
- **Send to Tweet Manager.** Send the list to Tweet Manager module for posting and scheduling of the collected tweets.

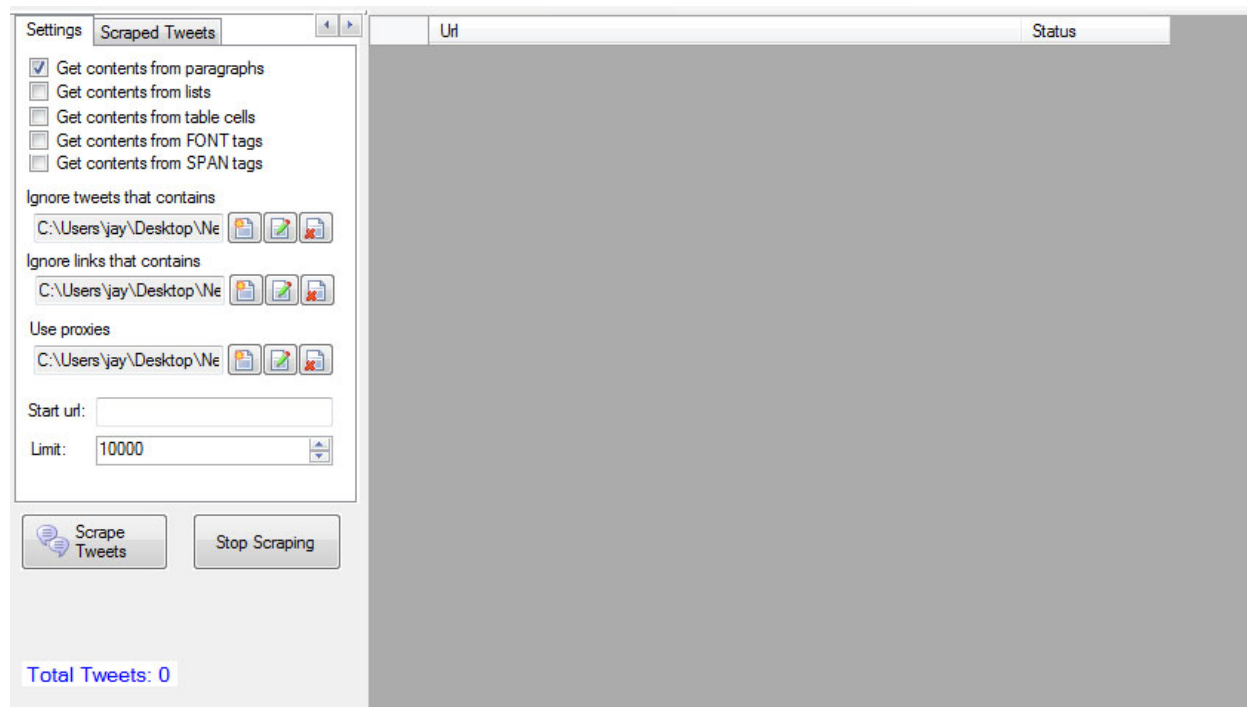

## Tweet Scraper Advanced

Tweet Scraper Advanced works the same way as the Tweet Scraper module. It will go to the selected website of your choice and grab the contents and generate tweets based on those contents. The main difference is that, with Tweet Scraper module, it can only fetch content from one page, Tweet Scraper Advanced will also go through the inner pages of the website automatically and get contents.

If you have a website called <http://mydomain.com>, it will not just scrape contents from <http://mydomain.com/>, it will also go automatically to the inner pages like <http://mydomain.com/page1/>, <http://mydomain.com/page2/> and so on. Which make it a lot more powerful than the tweet scraper module and saves more time in generating tweets.

## Tweet Scraper Advanced Options

If you look at the screenshot below, the options are pretty much the same with Tweet Scraper module and there are only 5 additions.

- **Ignore tweets that contains** This will allow you to put a .txt file that contains words or bits of text that you want TA to ignore, like if you are scraping contents from blogs. Blogs normally have text like “Powered by wordpress”, “Powered by blogger”, “Copyright” etc. You don’t want to tweet those texts don’t you? If you want TA to not include those text when scraping, just add them in a .txt file like this.

Powered by

Copyright

Just put it one per line and load the file in this option(using the first button)

- **Ignore links that contains** Blogs normally have links like <http://domain.com/wp-admin/>, <http://domain.com/categories/> etc which will just give us crappy or duplicate information that we cannot use as tweets. If you want TA to not read those links. Just add them in this option, the same way as you add tweets to ignore. You might want to add

/categories

/wp-admin

So TA will ignore any link that contains those texts.

- **Use proxies** This is not required but it is advisable that you use proxies when scraping contents because some websites block your IP address if you send many requests to their server at the same time.
- **Start url** Enter the url where you want TA to start getting tweets
- **Limit** the number of tweets that you want TA to generate for you.

## Reply\Mention Generator

This is one of the most powerful modules of TweetAttacks. It defines a new way of marketing in Twitter.

Most twitter marketers will build followers first before sending offers because normally, your tweets can only be read by your followers. With this module, you can create thousands of tweets and people can read them even if they are not your followers.

Confuse? I hope not.

Twitter have its feature called **@Mention** in their website, if you login your account you can see it immediately in your screen, the tab next to **Timeline**.

What it does is, it will load all tweets that contains the @ sign + your username and it will display it in your screen. For example, if your username is **myTwitterAccount**, when someone tweets with the word **@myTwitterAccount**, you will see it when you press that link; you will see the tweet even if you are not following the person who posted the message.

You still cannot see the power of it?

If you are promoting iPad for example, this module can search for tweets that contain any of your keywords. You can search for people who are posting something like "I want iPad" and fetch all the results. This normally returns thousands of tweets, thousands of people looking for your offer.

This module can then generate **@username** reply messages to those tweets, you can send them your affiliate link, your sales page, CPA offers and they can read it even if they are not following you.

This is definitely the fastest way to generate traffic and profit from twitter because you can send thousands of those messages everyday using our tweet poster modules that we will discuss later.

TweetAttacks reply generator have two parts\tabs, first is the scrape users.

## Scrape Users

In order for this @mention users to work, you will need a list of twitter users where you will send your messages and this section will help you

1. fetch users from search results
2. fetch users from someones followers list
3. and fetch users from someones following list

Scrape Users

Generate Reply

Use Account:

☒

☒

 Ignore users with no pictures

☐

 Use max limit

Limit

1000

Scrape:

Search Results

Search Term

Language:

Any Language

☐

 Ignore tweets with #hash tags

☒

 Ignore tweets with @

Fetch tweets with no links

 Fetch Results

The scrape users have the following options.

- **Use Account.** Some of the functionalities of this module needs an account to be logged in like when getting the list of followers of someone. And each accounts also have their own *replied list* to determine the people it already replied to (sent @messages to).
- **Ignore Users with No pictures.** This option will help you narrow down your search results as Tweet Attacks can check if the user who tweets the result have no picture as many bots do.

- **Ignore users included in the replied list** – You can check this option if you don't want to send replies to people you replied before.
- **Use Max Limit:** If you check this option, TweetAttacks will try to fetch the result list till then end of page or until you reach twitters maximum limit.
- **Limit.** Use this to specify the number of results that you want Tweet Attacks to fetch.
- **Fetch Results.** Use this button to start searching and fetch all the result to the grid in the right side of the window.
- **Scrape.** Select wether you want to get users from twitters search results or if you want to get the list of followers\following of a certain user.Scraping Users from Search Results  
If you selected the **Scrape** option *Search Results*, you will see the following screen.

- **Search Term.** Enter your search term to find your targeted audience that talking about your niche. You can also use twitter advanced search (<http://search.twitter.com/advanced/>) and copy the search term created and put it in this search box. More of this later.
- **Ignore tweets with hash tags.** If you check this option, TA will ignore the tweets with #.

**Fetch Option.** Other fetch options lets you

- **Fetch tweets with or without links.** To return results that contains links and those who don't have links.
- **Fetch tweets with no links.** This will search for the tweets with no links that are related to your search term. You can use this option if you want to fetch results that are looking for a certain phrases that may be related to your offer because many tweets that contain links that are related to your phrase may be offering the same product or services that you are offering.
- **Fetch tweets with link only.** You can use this option to identify other people who are writing or selling things related to your niche. You can search and create a list and generate a reply for them all or retweet all of their links to build relationship. You can use this trick so people will get notice of you and follow you.

### Scraping List of Users from Someone's Followers\Following List

If you selected the scrape option *Following or Followers*, you will see the following screen.

Scrape Users
Generate Reply

Use Account: Personal@10

☒ Ignore users included in replied list

☒ Ignore users with no pictures

☐ Use max limit

Limit 1000

Scrape: Followers

Get followers of

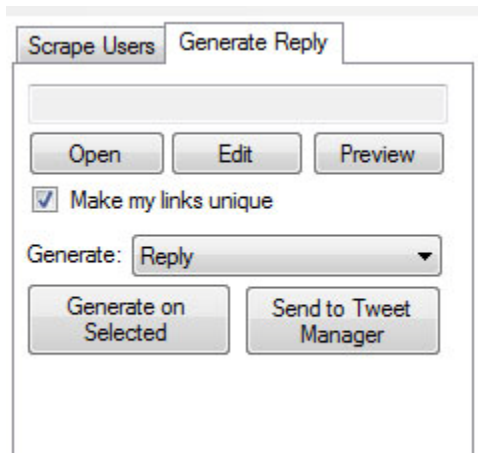

☒ Ignore users with links on latest tweet

 Fetch Results

You will just need to specify the username where you want to get the list of followers\following then your ready to go. After clicking the **Fetch Results** button, TweetAttacks will go through the list of followers\following of the specified user and list them in the table displayed in the right side of the window.

## Generating @Mention Messages

This section of @reply\mention generator will help you generate many @reply messages in few clicks of a button.

This section will let you create a reply for all the fetched users in **Scrape Users** tab.

It contains one text box which shows the file name where the tweets will be loaded.

The (.txt) file to be loaded should contain your replies, 1 reply per line, like:

Reply1

Reply2

Reply3

Etc.

You can also use {} spin syntax format.

**Open** – Use this button to change the file where you want your tweets to be loaded.

**Edit** – Use this button to edit your tweets in the text file. More about this later.

**Preview** – Use this button to test your tweets if you used the spinner properly.

- **Generate.**
  - **Reply.** This will allow you to generate replies on the highlighted tweets in the right side of the window. The reply to be generated will come from the content or spinned content in the text box above.

- **Retweet.** This will automatically generate a message to retweet the selected tweets in the right side of the window. This is useful when you want to retweet a lot of links or quotes that came from your search results.
- **Copy Tweets.** This is useful when you are running out of words to tweet, you can search something like *#quote* to fetch quotes posted by other people using the hashtag *#quote* and copy those tweet.
- **Generate on Selected.** Use this button to perform the action based on your specified options in the available options above.
- **Send to Tweet Manager.** This will send all the generated replies and retweets to tweet manager for posting and scheduling.

## Reply\Mention Generator Toolbar

 Select All 
  Delete Selected 
  Remove Duplicate Users 
  Add to Replied List 
  @mention Followers 
  Save 
  Load

**Select All.** Use this to select all records in the list

**Delete Selected.** This button will delete all the selected records in your list.

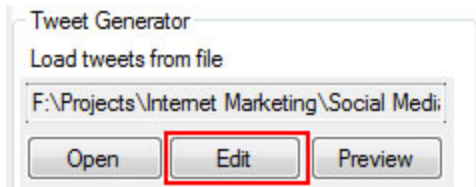

**Remove Duplicate Users.** You can use this button if you dont want to generate multiple tweets for a single user. Sending multiple @mention message to single user might annoy them and they will report you as spammer which leads to suspension of your account.

**Add to Replied List.** Each account has their database of replied list so TweetAttacks can learn and ignore users you already replied before. You can use the **Add to Replied List** button to add the users you fetched to the replied list so you can ignore them later in your next campaigns.

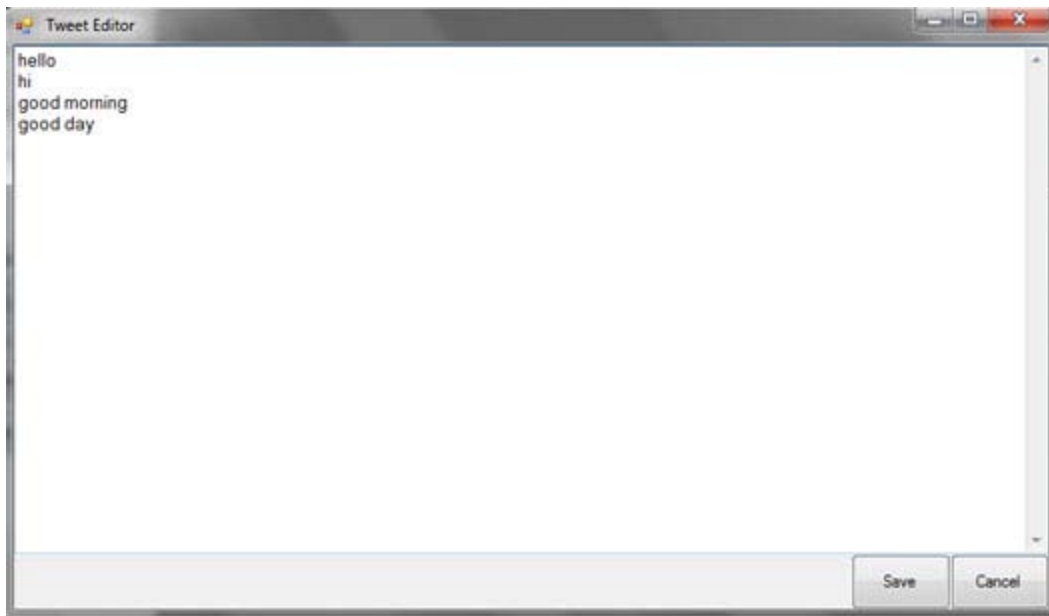

**@mention followers.** Sometimes, you may find good offers but no one is tweeting about it. So your next best option is to find the leading authority on that niche and generate @mention\@replies to its followers and promote your offers. For example, if you are promoting iPad and no one is talking about it, you can use this button to fetch the followers of Apple (I think this account does not exist) but I'm sure you get the idea. One another good example is that, when you are promoting products about blogging, you can fetch the followers of **problogger** and send them your offers. As of the moment, he have 98,000 followers, so using this feature you can send your offers to those 98,000 users even if they are not following you back. Imagine how many traffic and how much money you can make with that.

## How to use the Tweet Editor?

You can use the Tweet Editor to edit the tweets in the file you selected. To edit the file just click the edit button

After clicking the button, the tweet editor will appear with the tweets in the text file automatically loaded.

You can edit each tweet per line. You can out as many tweets as you want and you can still use the Jetspinner {} syntax to create more variations of your tweets.

Click **Save** to save the changes.

### How to Generate Replies?

TweetAttacks will let you generate reply of your search tweets in a click of a button. It supports the jetspinner syntax to generate multiple variations of your reply.

For example

{Check out|see|view|visit} this {cool|good|great|excellent} twitter {marketing|promotion}  
{software|application|tool} <http://tweetattacks.com>

Will generate many variations of reply eg:

**visit this great twitter promotion application** <http://tweetattacks.com>

**Check out this great twitter promotion application** <http://tweetattacks.com>

visit this great twitter promotion tool <http://tweetattacks.com>

see this excellent twitter marketing tool <http://tweetattacks.com>

view this great twitter marketing application <http://tweetattacks.com>

see this cool twitter marketing software <http://tweetattacks.com>

and many other variations.

To generate replies you can do the following.

1. Search for a term that might be looking for your product and put it in the search term box eg:

Search Term  
"twitter software" ▼

2. After setting the search phrase, set and put values for other options or you can leave the default

☒ Ignore users with no pictures

☐ Ignore tweets with #hash tags

Fetch limit 100 ▲▼

Fetch tweets with no links ▼

Fetch Results

In this case I want to fetch only the results that don't have any links because of the tweets with links are also promoting products related to my search term which is "twitter software".

3. Click **Fetch Results** to start searching. The results will be generated in the grid located at the right side of the windows.

8. You can now click **Send to Tweet Manager** for posting and scheduling or after **Tweet Manager** you can Save it using the **Save** button and load them later in **Tweet Poster** module for posting using multiple accounts.

## How to Generate Many Retweets?

Retweeting other tweets is a good way to get noticed by other twitter users and build relationships.

To use this feature you can simply the how to generate reply above and just select **Generate Retweet** instead of **Reply**.

To show you an example here is a way to do it

For example I want to retweet some twitter marketing tips tweeted by other bloggers for me to get notice and at the same time, giving value to my followers

1. I will search for "twitter tips"
2. Select All
3. Change the generate **Reply** to generate **Retweet** and click generate on selected
4. Retweets will be automatically generated

5. You can now click **Send to Tweet Manager** for posting and scheduling or after **Tweet Manager** you can save it using the **Save** button and load them later in **Tweet Poster** module for posting using multiple accounts.

## Tweet Manager

In this module, you can prepare your generated tweets for posting or post it using only one account.

You can set the date and time of each tweet when they will be posted or you can generate schedule based on your selected interval.

## Tweet Manager Toolbar

- **Shuffle.** This will be used to randomized and shuffle your tweets so that replies, quotes and retweets will be posted randomly manner.
- **Save.** Save the tweets so you can use it later. You can also use this button to save all your generated tweets then post them all together **Tweet Poster Module**
  - **Save Tweets Only.** This will save all your tweets without the generated schedules
  - **Save Tweets W/ Schedule.** This will save your tweets along with the generated schedulers.
  - **Save in Multiple Files.** If you have many tweets generated and you want to post it in batch or you want to post them using different accounts in Multi User Tweet Poster Module, you will need to save your tweets using this button.

If you have 10,000 generated tweets you can divide it into 20 files containing 500 tweets or 10 files that all contains 1000 tweets so you can post it using multiple accounts later in multi user tweet poster module.

- **Load.** Load previously saved tweets
- **Delete Duplicates.** This will remove the duplicate tweets in your list.
- **Delete Selected.** Delete selected tweets
- **Delete > 140 Characters.** This will delete tweets that have more than 140 characters because twitter only allow up to 140 characters.
- **Clear.** Delete all tweets in the list
- **Fine and Replace** you can use this button to find any text and replace it with anything you want through all the tweets listed. Its a good tool if you want to replace some text or to completely remove them.
- **Append Text** you can use this button to append text at the end of every tweets, like if you want to put your links at the end of the tweets.

## How to use Tweet Manager?

You can generate tweet schedules based on your set intervals.

**Tweet Poster**

☒ Start at current time

Start at

post every  to  Minutes

- **Start at current time.** Check this option to always use the current date and time for the generated schedules
- **Start at.** Use this option to generate schedule starting at a specified date and time
- **Post Every.** The interval of the tweet schedule to be generated
- **Generate (On selected).** Click this button to start generating schedules for the selected records only based on the options above
- **Generate (ALL records).** Click this button to start generating schedules for all tweets based on the options above

After setting the schedules just click **Start Posting from Web** to start posting or **Send to Socialloomph** to schedule it using socialloomph services.

**Note:** Free socialloomph user accounts is limited and the limitations are beyond our control.

## Tweet Poster

Tweet poster will let you post your generated tweets and replies. If you use TweetAttacks tweet poster, all of your tweets will be posted using a web browser so it will appear very natural as if they are typed and posted from the web.

This is also one of the most powerful modules of TweetAttacks PRO and this works best along with the reply generator module.

- You can generate thousands of @mention\@reply tweets using the reply generator module
- Send the tweets to tweet poster module then save them to separate files
- Use multi user tweet poster module to post those tweets using multiple accounts

Again, this method is the fastest way to get traffic from twitter even if your accounts have no followers at all.

**Tweet Poster** allows your tens, hundreds or even thousand twitter accounts to schedule and post tweets at the same.

It allows you to load saved tweets from the **Tweet Manager** module.

**Tweet Poster** has the following options

- **Use schedule included in the text files.** This allows you to use the schedules generated using the tweet poster module.
- **Post between.** Use this option if you don't want to use the generated schedule from tweet poster module and TweetAttacks will generate random number between the 2 numbers selected.
- **Delete Posted tweets in the file.** Check this option if you want the posted tweets to be so they will not be posted again in case you accidentally ran the same file or if you want to stop posting and continue later.
- **Only login x accounts at a time.** This is useful if you are logging in many accounts that your computer or twitter server cannot handle. It will use all selected accounts but it will not login them at the same time and wait for the first batch to finish logging in and it will start logging in the other accounts once the first batch are already posting. Please note that, it will not wait for other accounts to finish posting, it will only wait for other accounts to finish the login process before starting other accounts.

## Tweet Poster Toolbar

- **Load All Accounts.** Use this button to load all your twitter accounts in the table.
- **Export.** You can use this button to save the tasks you assigned in the table and load them again later for new campaigns.
- **Import.** This will load the tasks you saved using the export button.
- **Set Files.** Use this button to assign text files to all of your selected accounts. This button will let you select a directory and then all text files in that directory will be assigned to each of the selected twitter accounts for posting.

## How to Use Tweet Poster Module?

You can use reply generator and tweet scraper modules to generate content for tweet poster module.

1. Save the generated tweets in tweet manager module.
2. Switch to **Tweet Poster** module
3. You can use **Load All Accounts** button to load all your accounts in the tasks table
4. After selecting the users, open text files where the tweets should be loaded by clicking the button as shown in the screenshot above.
5. After assigning the text files, click start posting and watch your accounts post tweets simultaneously or just leave and tweet attacks will do the posting for all of your accounts.

## Wait and Reply Module

Wait and reply module allows you to spy on other peoples tweets. Once tweetattacks found a tweet that is relevant to your offer, tweetattacks will automatically reply to that tweet. You can set it to reply that contains your affiliate link, CPA offers, and new blog post or just about anything.

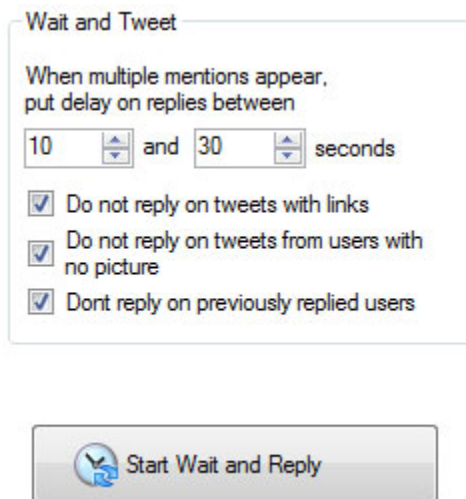

This module and the reply generator will allow you to drive traffic to your website even if you don't have followers.

You just need to give the right offer and you need to work on the right niche. (More on monetization later)

## How Wait and Reply Works?

TweetAttacks will use <http://search.twitter.com/advanced/> to search for people who are talking about your niche. Then it will wait for a new one then immediately send your offer to that person using @reply so the user can see it even if he is not following you. With this module alone, there is a high chance that you can get back your investment in the first few hours of using it like many of our customer does.

TweetAttacks Wait and Reply Module have the following options

Wait and Tweet

When multiple mentions appear,  
put delay on replies between

10 and 30 seconds

☒ Do not reply on tweets with links

☒ Do not reply on tweets from users with no picture

☒ Dont reply on previously replied users

 Start Wait and Reply

- **When multiple mentions appear, put delay on replied between.** Set the delay between replies. Delays will be randomly generated between those 2 numbers on each requests for a more human and random behaviour.
- **Dont reply on tweets from users with no picture** Based on my experience, most of those users who don't have picture are bots and spammers. Check this option to ignore them.
- **Dont reply on tweets that contains links** Many spammers and bots only tweet links. You can check this option to ignore them.

- **Don't reply on previously replied users** Replying to the same user over and over again may result for the other user to get annoyed and report you as spammer. You can check this option to prevent it.
- **Make links unique** If you check this option, TA will make your links unique by appending extra characters at the end of your link. If your link looks like, [www.yourdomain.com](http://www.yourdomain.com), it will make it [www.yourdomain.com?=xygk](http://www.yourdomain.com?=xygk) that link will go to the same destination but it will look different to twitter.
- **Run all tasks at the same time** By default, this option was checked and if this was checked, TA will run all the tasks at the same time. This is not good if you set up many tasks to post the same link or if they are running on the same IP address (no proxies). Your accounts will last longer, if you uncheck this option and run only few accounts at the same time.
- **Post tweet continuously until account get suspended** You have an option if you want your accounts to post replies until they get suspended or make the tasks stop after certain number of tweets posted.
- **Repeat and rotate tasks** This option is only available if you chose to pause\stop the tasks after certain number of tweets. This will make TA, automatically rerun the stopped\paused tasks.
- **Start Wait and Reply** Click this button to start your campaigns and wait for the traffic and money comes in.

## What Are Normal Tweets and Why We Need it?

Normal tweets are just tweets that are not @reply messages and preferably NO LINKS, NO #HASHTAGS. They are the tweets that TA will post between your @Reply messages to make it look more normal.

They can be jokes, quotes or any tweet without links, without @mentions and better if no #hashtags.

Here are some benefits for using normal tweets in wait and reply

1. **Your accounts will last longer**, if your accounts only tweets @reply messages with links, there is a huge chance that twitter can detect it and suspend your account. If you are not posting normal tweets between @reply messages, your account will look very spammy and most probably other twitter users will report your account as spam and it will end up being suspended.
2. **You can get more clicks**, it's very simple, if someone sent a @reply to you and you saw that the account is also sending it to many other users, will you click it? Probably not.

Normal tweets should also be inputted in a .txt file, you can easily do it using notepad. One normal tweet per line eg:

Normal tweet one

Normal tweet two

Etc.

Then load the file in the **Normal Tweets** column.

## Where to Get Normal Tweets?

Normal tweets can be any tweets that have no links, @mentions and #hashtags, and here are some fast ways to get some.

1. **Use Tweet Scraper or Tweet Scraper Advance Modules**, using the browser in Tweet Scraper module, open a website preferably blog related to your niche and grab tweets from different articles. Send to Tweet Manager then save it to text file using **Save->Tweets Only**.
2. **Use @Reply Generator**, as you may already know by now, you can use @Reply Generator module to fetch thousands of tweets related to your searched keyword. When searching just fetch only tweets with no links and check ignore tweets with #hashtags and check ignore tweets with @.

If you want to use quotes as your normal tweets, just **uncheck ignore tweets with #hashtags** and search for #quote or #quotes. **Send to Tweet Manager**, then in Tweet Manager, use **Find and Replace** button to replace #quote and #quotes to empty\blank characters (just to remove the #hashtags. After that use **Save->Tweets Only** to save your normal tweets.

## Wait and Reply Toolbar

- **Load All Account.** As the name implies, you can use this button to load all your accounts in the list so you don't need to select them all one by one. You can load all your accounts, targeting different keywords and let them run 24\7.
- **Select All.** This will highlight all items in the list
- **Delete.** This will delete all the items selected in the list
- **Load.** Use this button to load tasks you previously saved using the save button.
- **Save.** Use this button to save all the tasks you created for this module.
- **Set Search.** If you are using multiple accounts to target the same keyword, you can use this button to set the keyword to the selected accounts in the list.
- **Set Language.** Use this if you want to set languages at once for the selected tasks.
- **Load Replies.** Use this button to set and load replies file (.txt file) to all the selected\highlighted tasks at one.
- **Load Normal Tweets.** Use this button to set and load normal tweets file (.txt file) to all the selected\highlighted tasks at one.

- **Load Normal Tweets (from directory).** Use this button to set and load replies file (.txt file) to all the selected\highlighted tasks at one. It will let you select a directory and TweetAttacks will get all (.txt) files from that directory and assign them in the selected accounts.
- **Import Keywords.** Use this button to import keywords from a .txt file. The file should contain 1 keyword or key phrase per line, eg:

Keyword1

Keyword2

Keyword3

- **Assign Accounts.** Use this button if you want TA to automatically select account for the selected tasks. This is normally useful if you have batch of tasks that have suspended accounts, select those tasks (by highlighting the records) and click this button. It will randomly select and assign accounts for the selected tasks.

## How to use Wait and Reply Module?

After switching to Wait and Reply Module, in the right side of the TweetAttacks window you will see the following empty table.

<span>Load All Accounts</span> <span>Select All</span> <span>Delete</span> <span>Load</span> <span>Save</span> <span>Set Search</span> <span>Load Replies</span> <span>Load Normal Tweets</span> <span>Import Keywords</span> <span>Set Language</span>								
	Accounts	Search	Language	Replies	Load File	Normal Tweets	Load File	Status
▶*	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	

First, fill up the following columns

- **Account.** Select the account that you want to post tweets\@replies
- **Search.** This is the column where you will need to specify your target keyword. Eg: If you are promoting iPad offers, you might want to search for people who are talking something like “I want iPad”.
- **Language.** Select the language that you want to target, if want to target certain countries or certain place only, you might want to filter the searches by language.
- **Replies.** This is where your text (.txt) file is located. This text file should contain your replies, one per line. You can spin it using the jet spin syntax.

You can create your text file using notepad or any other text editing program.

Your file should contain your replies, you can build many replies in single file and TweetAttacks will select one to post automatically.

It should like this

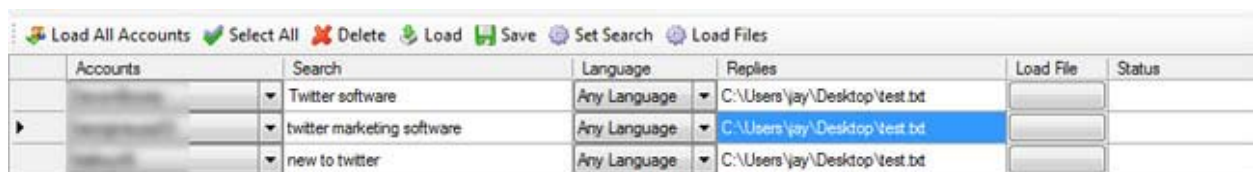

Lol I got a new iPad at <http://yourlink.com>

I think apple {is crazy|gone mad}, they are {giving|throwing} away free iPad <http://yourlink.com>

Save it to any filename that you want.

- **Load File.** Use this button to load the file for the **Replies** column so you don't have to type the path manually.
- **Normal Tweets.** In here you should input the (.txt) file where you saved your normal tweets
- **Load File.** Use this button to load your **Normal tweets file** so you don't have to type the path manually.

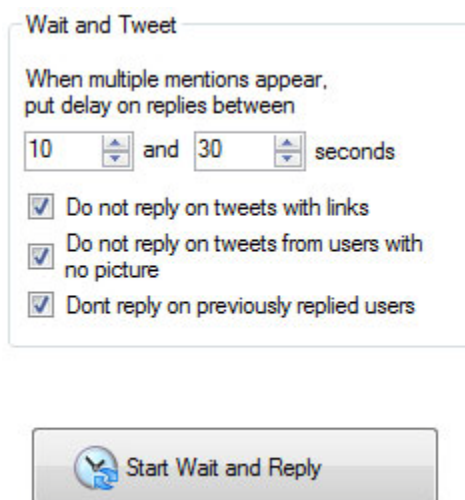

You can set up multiple rows to the table using different accounts and keywords like the screenshot below

Accounts	Search	Language	Replies	Load File	Status
[blurred]	Twitter software	Any Language	C:\Users\jay\Desktop\test.txt		
[blurred]	twitter marketing software	Any Language	C:\Users\jay\Desktop\test.txt		
[blurred]	new to twitter	Any Language	C:\Users\jay\Desktop\test.txt		

*In the screenshot above, I selected the accounts (first column which are blurred). Then I selected my keywords which are twitter software, twitter marketing software, new to twitter. I selected any language but you can change it if you want to target specific languages but since twitter users are all over the world, I just leave it to default. Then I loaded the text file I created that contains my replies and normal tweets using the Load File buttons.*

After setting up, setup the options in the left side of the window to your desired setting

Wait and Tweet

When multiple mentions appear,  
put delay on replies between

10 and 30 seconds

☒ Do not reply on tweets with links

☒ Do not reply on tweets from users with no picture

☒ Dont reply on previously replied users

 Start Wait and Reply

Thats it, you can now click **Start Wait and Reply** and watch the traffic grow.

## ReTweet Attacks

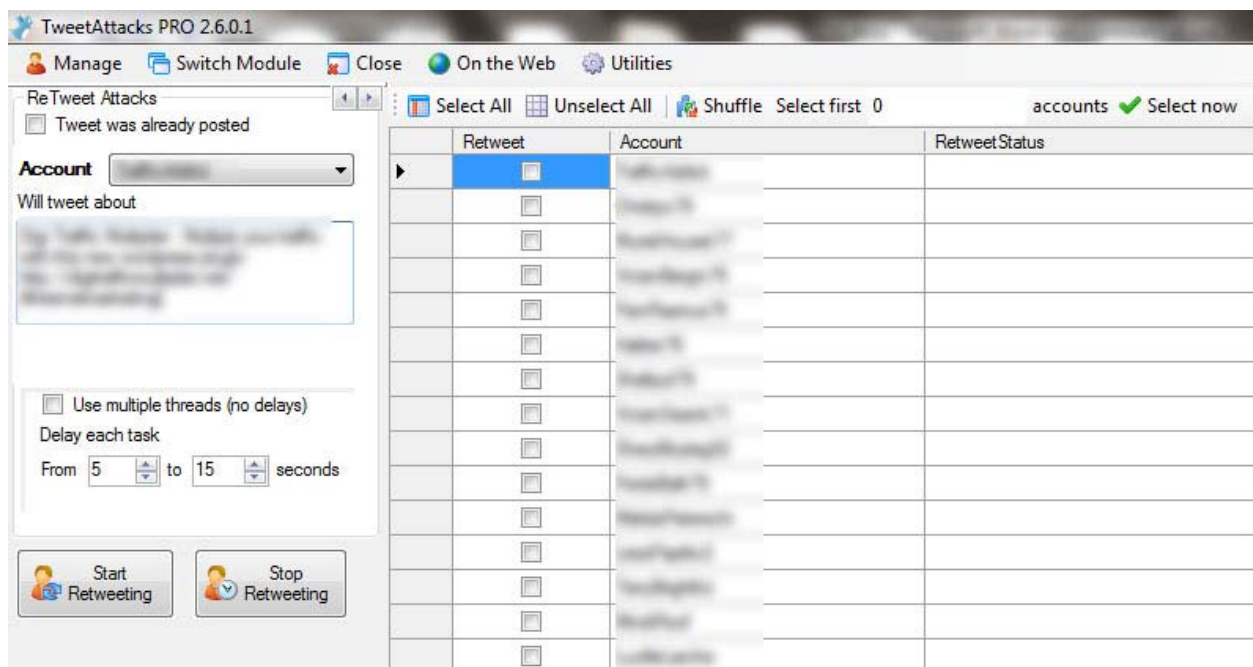

If you have tens or hundreds of accounts with each thousands of followers tweeting your url. Retweets have higher click rate than normal tweets.

If you have 20 accounts and each have 5000 followers, your offer will become visible to  $20 \times 5000 = 100,000$  users instantly - with single click of a button

### Get instant tons of backlinks from high PR sites

When your link retweeted by many other users, the tweet will be listed in many retweet statistic sites and will give you many many backlinks and gain authority.

ReTweet Attacks have this screen

### ReTweet Attacks Options

- **Tweet was already posted** check this option if you want to retweet a tweet that was already posted. If this was checked, you will need to enter the url\link of the tweet. To know the link of the tweet, go to your twitter profile and browse through the tweets. You will normally find the link by (see screenshot below)

Compassion and love give meaning to our activities and makes them constructive.

2:34 AM Apr 8th

[Click this to get the url](#)

Reflect on the value of inner versus outer wealth; in our world, there is a new awareness of our inner life and its worth.

2:36 AM Apr 7th via web

HHDL is greeted in traditional manner at the Maharaja Sansar Chand Museum inauguration in Kangra, India on April 6 <http://twitpic.com/4hj9op>

3:05 AM Apr 6th via Twitpic

url normally look like <http://twitter.com/DalaiLama/status/56288723838570496>. Just copy the url and paste it in the url box.

- **Account** this option is only available if you unchecked the first option. The account you put in this option will be the account TA will use to post the tweet that will be retweeted by other accounts.
- **Will tweet about** this is the box where you will need to put the message that you want to tweet.
- **Use multiple threads** Check this option if you want TA to use run multiple tasks at the same time (1 thread = 1 task). A word of caution though, if you check this option and use multiple threads, make sure that your accounts are running from different IP addresses using proxies. If you are not using proxies, just leave this option unchecked and use high delays between tasks to prevent account suspension.

## How to use ReTweet Attacks?

1. Switch Module to ReTweet Attacks
2. Check the option **Tweet was already posted** if you want to retweet a tweet that was already posted before. Otherwise, uncheck that option.
3. If you checked the option **Tweet was already posted**, just enter the url of the tweet in the url box. Otherwise, select the account that you want to post the tweet.
4. Put the initial tweet in **Will tweet about box**, you can put your offers or links in this box. You will not see this option if you checked the first option (step 2).
5. In the right table, check the accounts that you want to retweet the message
  - a. You can click select all button to use all of the other accounts
  - b. You can also select only the first # of accounts. For example if you want to select only the first 10 accounts just put 10 in **Select first** text box then click **Selec Now**. **You can use the shuffle button to shuffle accounts before selecting the # of accounts for you not to select same accounts over and over again.**
6. Click start retweeting to start your campaign.

## Others

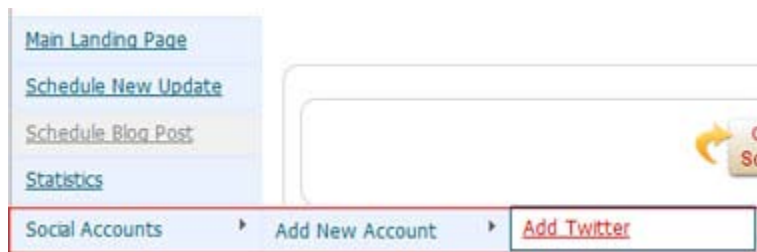

### Adding Socialloomph Accounts

TweetAttacks is not dependent to this feature or with socialloomph. TweetAttacks will run with or without this so you can skip this section if you are not using socialloomph or have no intention of using their services.

Please note that TweetAttacks is not associated with socialloomph. Socialloomph is a different service from a different provider. We are only using their services using their developers API.

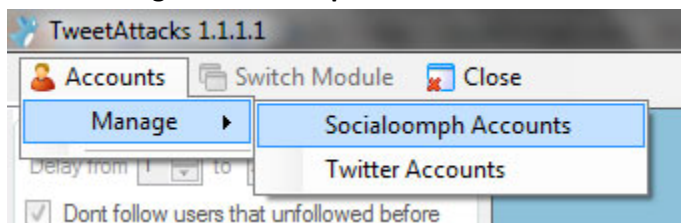

If you don't have socialloomph account yet, you can create one at <http://www.socialloomph.com/>

After registering a new account in the website, you need to add your twitter accounts in their website by going to **Social Accounts -> Add New Account -> Add Twitter**

After creating and adding your twitter accounts in socialloomph. You can add your socialloomph account in TweetAttacks by

1. Go to **Manage->Socialloomph Accounts**

2. Fill up all of the information and click save

**Username.** Your socialloomph account username

**Password.** This is your socialloomph account password

**API Key.** As Im writing this manual, this is not yet required by the socialloomph API. You can get your API key by logging in to the socialloomph website and going to

<https://www.socialloomph.com/users/apikey/>

### How to send tweets to socialloomph?

Before using this module, make sure that

1. You have socialoomph account
2. Your twitter accounts was already added in your socialoomph account
3. Make sure that in TweetAttacks, your socialoomph account is added in the socialoomph account manager
4. Your socialoomph account is connected to your twitter account in twitter account manager (last column)

## Part 2: Monetization

This section of the user's manual is all about our main objective, "monetization". In this section we put all of the TweetAttacks features into action.

We designed TweetAttacks to be very scalable and it should fit to any monetization methods you currently have. But if you are just starting out with Twitter, we provided some methods. These are basic stuffs and you can always modify and improve them. Learn to measure your results and act accordingly. Twitter and twitter users behaviour is changing everyday so we really advice that only hte methods here if you cannot create your own yet. But we really highly recommend that you test these methods first and make your own adjustments because many other people is already using them.

Before going into the methods, let start in choosing our offer or products to promote.

### 5 Tips in Selecting Products\Offers to Promote in Twitter

There are many places where you can find many products to promote. For affiliate products we recommend <http://clickbank.com> if you want instant commission products (which I prefer the most) use <http://rapbank.com>, in rap bank, you can find products that will send commissions directly to your paypal account and it will be sent immediately just like in [TweetAttacks affiliate program](#).

You can promote any product but I want you to consider few things when selecting your product because based on our experience with twitter, many products don't work well.

1. Try searching in <http://search.twitter.com/advanced/> if there are many people looking for your products. Just look at the first page of the result and look, if there are more people looking for it than people tweeting links that promoting it then go for it. And also check the dates of the tweets; if they are posted within few days interval then it's not a good idea to go for that niche.

If there are few tweets that looking for that product\services, there are times that it's still worth the effort to go for it. Like if the commission is good enough.

2. Do a small research on that niche, you can use google search or <http://twellow.com> to find leading authority in that niche and find out if they have twitter accounts. This is important because, later in our monetization methods, you can use TA to add or contact their followers directly so you can send them your offers.
3. Women, children and teens are easier to convert than man in many niches. Niches for women should work great. Not just in twitter but in most household, women or the mother have the strongest purchasing power and their children can easily persuade their mother to buy things.
4. People in twitter don't normally use twitter to look for something to buy so freebie offers works best. You might want to promote freebie CPA offers. Especially in the entertainment industry. A 3-5 figures a day with this can be easily obtained. (More of this later)
5. Internet marketing niche is good in twitter but you should expect heavy competition. If you can find a new breakthrough product in the internet marketing niche, like a new software, new eBook etc. That will be a great chance, since there are many internet marketers like us in twitter who are very hungry for new information and tools.

## Method 1: Build and Attack

This is the oldest twitter marketing method. It's still very effective to drive traffic to your blog, sales pages or affiliate links. In this method, you will be building large number of followers, building popularity and authority before sending out your offers. I find this as one of the most ethical way or white hat way of marketing in Twitter. This method is good for long term businesses. Once you have number of accounts built, you can monetize it in almost anything you can think of.

### PROS:

1. Very good for long term business
2. Once you have it set up, you can monetize it in almost any way that you want
3. Your account will have very less chance of getting suspended
4. Very good approach if you are creating a brand and authority in a particular niche
5. This can create a snowball effect, as your account grows, it will grow even faster

### CONS:

1. Requires more time and work than the other methods

In this method, you will need the following TweetAttacks modules

1. Follow\Unfollow Module
2. Tweet Scraper Module
3. Tweet Poster\Multi User Poster (optional)
4. Account Statistics

## **The Method**

### **Step 1: Find product\offer**

Before we start marketing in twitter, it's always best to find a good niche. [You can refer to this section for some tips](#). You can find products in clickbank or any other affiliate marketing websites or create your own product, if you are thinking between the two, you might want to read one of my blog post here [Affiliate vs Product Owner: Which One is More Profitable?](#)

### **Step 2: Create a website or small landing page**

This is optional but I recommend that you build your own website for that particular niche. You can create either a blog, autoblog or just a simple landing page. If you need a reliable hosting solution we highly recommend <http://www.1and1.com/> we are using their services since the beginning of our internet ventures. And if you are not a programmer, use wordpress, and just use free templates.

### **Step 3: Create your twitter account**

In this method you will need to create twitter accounts. I suggest that you build one account per niche so you will not mix up topics between niches because sometimes, posting messages that are not in the interest of your followers might lead them away and ignore your future messages. For faster account creation, you can do it manually or get our Twitter Account Creator at discounted price using this link <http://tweetattacks.com/ac/>.

In your account, make it look good by providing good pictures and beautiful background. It should look very real as much as possible so you can get more followback rates.

### **Step 4: Build Followers**

After building your accounts, we will build followers for that account. There are many ways to do this but one of the most effective ways to build followers is to follow them first and here is how I'm doing it.

First of all, after creating a new account, I don't use it for following on the same day. I'm just editing the profile, adding pictures, post some tweets then start following after 2 or 3 days.

#### **Follow people**

Using TweetAttacks follow module, you need to auto follow people who are talking about your niche or the followers of the people who already established an authority in your niche. For example if you are in the blogging niche and you want to promote your product to bloggers. Using the browser in TweetAttacks just search for something like

*I just started blogging*

*New blog post*

And follow those people

Or you can just auto follow all the followers of *problogger* which have over 100,000 followers.

**If you don't know how to use the follow module yet. Please refer to the part 1 of this report.**

For newly created accounts, I only follow 50 to 150 a day until my followers count reached 400, after reaching 400. I follow 200-400 per day until I reach 700 followers.

After 700 followers, make it 300-500 a day until you reach 1000

Then 400-600 until I reach 2000.

When I have 2000 followers, I do follow 900 - 1000 a day but you can do only 400-600, it's much safer.

**Note:** Twitter might show a notification about your follow limit even before reaching those numbers because of many other conditions.

**Like you cannot follow more than 2000 if you have less than 2000 followers.** After reaching 2000 (not exactly 2000, I think its 1820) followers you can then have a following limit of 10% more than your number of followers. Until then, you need to unfollow so you can follow more.

Meaning, if you have 2000 followers, your overall following limit will be  $2000 + 10\%$

Which is  $2000 + (2000 * .10) = 2200$

### **Unfollowing**

I only unfollow users who don't follow me back after 2 days and I don't protect my mutual followers most of the time so I can follow more people per day.

You can do this to all of your accounts. You can use the follow\unfollow module in TweetAttacks so the building of followers will be done for you even without your presence.

Leave this instance of TweetAttacks open so it can proceed with the work.

### **Step 5: Posting Updates**

**Open another instance of TweetAttacks.** This instance will do the tweet posting.

In this method you should be very careful in posting tweets, I recommend that you do not post more than 20 a day because your followers might report your account as spammer and don't post too much links. If you are posting too much, your followers might learn to ignore your future tweets and you will get no result.

**Always try to post tweets related to your niche**, you can do this by using the tweet scraper module, using the built in browser in TweetAttacks go to google and search for your keyword. Open any blog or article about your topic, and create tweets from that content using the grab tweets button. Then send those tweets to tweet manager.

Generate schedule for the tweets for every 2-3 hours.

### **Posting Your Offers**

This depends on your preferences but we recommend that you should at least have 1000 followers before sending your offers. And as much as possible, do it only once or twice a week so your followers will not leave.

### **Best Time to Send Your Offer**

This is one of the most important part because the timing is very crucial, there are millions of tweets being posted everyday and you want to make sure that your message can be read by your prospects. You need to make sure that most of your prospects are online and using Twitter the time you send it to them. The timing still depends on your offer but there are certain days and time that people are most active in twitter than other days or time of the week. That is every **Thursday at 5AM to 7AM GMT +8**. We get more click rates on that exact same day and time. But this still depends on your geographic target, you should consider time zones and when is the time your followers is more active in twitter.

It is also good to post and send your offer **before and during normal pay dates of the employees and holidays**.

You can use Tweet Poster module to schedule your tweets\offers on those exact time and dates.

Try it and see for yourself.

**Note:** You can do this to all of your niches but don't use Tweet Manager Module because it can only post to one account, you can save all the tweets then load them all later in Tweet Poster.

### **To summarize it**

In this method, you just need to create a small landing page or you can use your blog. Then build targeted followers to your twitter account by scheduling TA (Follow Scheduler

Module) to follow and unfollow people every day. Then open another instance of TA, so you can schedule your tweets related to your keyword. And also you can schedule when you will send your offers.

You will just leave your computer running or repeat the process from step 4 and watch your website traffic growing as well as your sales.

You can also build multiple accounts for only one niche, that will be better so you can have your list faster. Then use ReTweetAttacks module to retweet your offer to all of those twitter accounts.

Good luck.

## Method 2: Sending CPA offers directly

**Before we begin, by doing this method there is a chance that you might lose some accounts so don't do this using accounts that are dear to you.** Or if you want to use your valuable accounts, make sure that you mix normal tweets along with your @mention tweets and use high delays. But you can definitely have more success using many throw-away accounts.

Im not really sure if this is blackhat or not because what we are going to do is to give direct answers to people who are in need of our services or any offers.

Like when someone tweets "I want an ipad", we will send them CPA signup offers that they might win iPad prices. We are still helping that person to have an iPad so I can't see anything wrong here unless you use it and you @reply weight loss products to people that want ipad.

Alright, this method is very effective; this is the method that our beta testers used to create more than \$100 a day during TweetAttacks testing period. This involves sending offers directly to people who are in need of your product and services using @reply or @mention tweets.

### PROS:

1. This is the fastest way I've seen to make money online
2. You don't have to build followers first to get results

### CONS:

1. You might lose some accounts when doing this so better use throw-away accounts

In this method you will need a lot of twitter accounts and I suggest using our twitter account creator which you can get here <http://tweetattacks.com/ac/> it will help you create thousands of email verified twitter accounts every day.

**Important Note:** In this method, you should use throw away accounts or accounts that are not valuable to you because there is a big chance that it might get suspended.

I assume that you already have account in any CPA network. If you don't have one, you can register at <http://maxbounty.com> or <http://neverblue.com> or any CPA network. There are lot of networks out there.

**Step 1:** In your account in any CPA network, look for offers that accepts social network traffic. Preferably email or zip submits and target those niches with addicts, fanatics or females. (They convert well for me) And I like freebie offers.

Example;

- Free bestbuy gift check
- Free movie ticket
- Free ipad

**Step 2:** Create throw away accounts and let it age for at least 3 days. If you can wait till 1 week that's better.

Use real human names in your profile and put profile pictures. You can easily do this with our account creator [here](#) but you can do it manually if you prefer so. You need to appear very real to your prospects so you can get more clicks.

Here is how you do it, in day 1 create accounts, edit profile pictures, post at least 2 or 3 tweets, follow at least 10 people then leave it for 3 days to one week. The longer the better because twitter is suspending accounts very quick if you use them immediately in sending @mention messages.

Its also very important that your accounts are email verified because users in twitter can no longer see your @messages if your account is not verified.

**Step 3:** When your account aged, open TweetAttacks and use Reply Generator module. Look for people who are tweeting about your products. If there is no one, just @mention to someone's followers related to your offer using the **@mention followers button** (you can find out how to use this module in part 1 of this manual).

**Step 4:** Generate a reply, put different variations by using { } syntax. Its also better to shorten your link to various shortening services. So they don't look the same and very spammy then put them in { } syntax. Use the make links unique option for obvious purposes.

When creating your messages, make it very natural and conversational.

For example in the free bestbuy gift check offer

*LOL best buy must be crazy to give something like this (link here)*

*LOL I just bought my new ipod using this free bestbuy gift check here (link here)*

And for movie ticket

*I'm not going to watch "movie title" even if they are giving free ticket here (link here)*

*It sucks, I don't need this "movie title" free ticket (link here)*

If you send that to fanatics, they will definitely react. Be creative and remember **people buy on emotion and justify with reason.**

**Step 5: (Optional)**

Put popular #hashtags in your tweets. To know more about hashtags please see

<http://twitter.pbworks.com/Hashtags>

And to find the most popular hashtags in your tweets, you can look at <http://twubs.com>

By adding related and popular hashtags in your tweets, your messages have more visibility.

**Step 6:** Scrape additional contents to mix up tweets with no links so that you may not look very spammy. If you generated 100 @mention\@reply messages in step 4, add 200 to 400 messages with no links. You can scrape news contents or use reply generator module to search for the #hashtag #quote to get quotes. Change the **generate** option to **just copy their tweets** to copy all those quotes.

**Step 7:** Send all your tweets to **Tweet Manager Module**. Shuffle it using the **Shuffle** button so the tweets with links and no links will mix up. If you have huge list of tweets you can save it to multiple files, using the **Save to Multiple Files** button, it will divide your list into multiple files so you can load and post them using multiple twitter accounts.

**Step 8:** After saving the files. Go to **Tweet Poster Module**. Load your accounts and assign them the text files. Set delays, **I'm using 5 to 15 minutes delay**. The longer the delay, the less possibility of your account to get suspended. Play around and experiment with the figures and learn what works for you.

Once you set up everything, start posting, and then after few minutes, login to your CPA account and see the traffic growing. ☺

After sending hundreds or thousands of tweets with your offer, It's almost impossible that no one will click and grab them.

The biggest factor here is on how you choose your target niche and how you construct your messages. In choosing your niche, refer to our tips [here](#). Start with freebie offers; it will be very hard for you to sell something that cost some bucks if you cannot even sell something for free.

This method will work using affiliate links as well.

Good luck!

### Method 3: Wait and Reply

This module alone can help you build your entire online business.

This method is almost the same with method number 2, the major difference is that, this method focuses on replying to future tweets while the 2<sup>nd</sup> method replies to past tweets and to the followers\following list of someone.

The process of selecting the right offer is also the same.

Instead of using Tweet Poster to post your tweets, you can setup Wait and Reply to do the job then it will do the job for you 24\7.

This can also be used to drive traffic in our next method.

### Method 4: Promoting High Priced Affiliate Products

In twitter it's hard to convert products with high price tags because after giving people the information, people don't normally buy right away. In this case methods above will not work very well, it will work but most of your traffic will be a waste.

This is almost the same with methods 1 and 2 but we just added a little touch so the traffic will not become waste. If you are selling products with high price tags, people normally needs some time to think and decide.

So in this section we will be building our list. As most IM gurus are saying *"The money is in the list"*. If you can contact more people, you can send them offer anytime. If you are not building your list yet, better start now and this guide will help you do that.

**Step 1:** This time you really need a landing page, a small landing page will be good enough. You can use wordpress or just simple html file.

If it's your own product, you can use <http://rapidactionprofits.com> its a good script to setup your own affiliate program and they also have a good template for creating your sales pages which is very useful if you are just starting out. This is the same script we are using in [TweetAttacks affiliate program](#) and our new product [SerpAttacks](#).

**Step 2:** This time we also need to build our list, since they don't buy right away, we need to capture their email addresses so we can send them follow ups later. I recommend that you sign up to <http://aweber.com> its the best mailing software out there, we are using them and very satisfied with the results. Not just because of its stability and cost but mainly on the features. You can schedule your follow up messages with it very easily.

In order to get their email addresses, one of the best ways is to give them something for free. You can create or rewrite some reports or buy cheap PLR product for this purpose.

**Step 3:** Create a new list in aweber then get your form and put it in your website.

**Note:** Aweber provides detailed video tutorial on how you can use every features in their website.

**Step 4:** After creating your website upload it to your hosting provider. If you don't have one yet, just register in <http://1and1.com>. After signing up, upload your file using your favourite FTP tool. For this we use <http://filezilla-project.org/download.php>, its a free but great FTP client.

**Step 5:** In your aweber account, go to **Messages->Follow Up** and create series of follow up messages. Tease and tell them what they can get if they buy the product.

The best human motivations are the 2 P's, pain and pleasure; they normally buy because they want to go away the feeling of pain or loss. Or they want the pleasure of having it. On your first messages, try focusing on the benefits or the pleasure they can get with your offer. After 3 or 4 messages, focus your last follow up message with pain. Tell them the negative stuff they might get if they will not act etc.

Don't forget to include your link in your messages, 1-2 links will be good enough so your messages will not be treated as spam. And as much as possible, don't use the word "free" because many spam filters don't like that word.

Send and schedule the follow up messages every 2 or 3 days.

**Step 6:** Now you have your website and aweber set up, the only thing that you need now is targeted traffic. You can use the 3 methods described above to drive traffic to your website. With method number 2 and 3 you can drive thousands of traffic per day. If you capture at least 1% of that traffic, and convert 1% (which is very easy to get) of that via your aweber follow ups. Just do the math If you are promoting product with 100\$ commission.

**Step 7:**

## How I Increased my Opt-in Rate by 400%?

With the traffic generation methods described above especially 2 and 3, you can literally drive thousands of traffic per day but many of that traffic will not buy right away especially if you are offering high priced affiliate or your own product. And in order to convert them, we need to capture their email addresses and send them follow ups.

**Note:** This is only useful if you have aweber account. You can always create your account in <http://aweber.com>

This is one of my personal favourite methods.

In most of my websites, Im getting thousands of traffic everyday but the conversion is poor because most products Im selling costs more than 100 bucks.

I increased my conversion rate when I decided to capture email address in my aweber account and send automatic follow ups. But I wanted more because I still have thousands of traffic left to convert. In order to do that, I need to increase the opt-ins.

The solution I found is very simple, just use **pop up boxes or exit pops**, like the one Im using in TweetAttacks website.

Pop up boxes appear immediately when a visitor visits your page, your opt-in form should appear in the pop up box and give them something valuable like free ebook or anything.

The other one is **exit pop**, I prefer this one because it will only appear when visitor leaves the page. When the visitor leaves your page like closing the browser or clicking the back button, it will be notified in your opt-in page. This simple solution increased my opt-in rates by 400% and im receiving hundreds of subscriber's everyday for most of my websites because of that simple script. You can find free scripts like that on the web but you need to test carefully if it works with all browsers. Personally I use the script from <http://www.exitsplash.com/> it updated immediately if there are some browser changes that cause it to not work properly. No extra hassles. You should consider putting like that in your product pages to increase conversion and not put your traffic into waste.

## Twitter Limits

You can find the updated limits in following, direct messages, posting in this link <http://support.twitter.com/entries/15364-about-twitter-limits-update-api-dm-and-following>

## Common Reasons Why Twitter Suspend Accounts and What are the Solutions?

### 1. If you have followed a large amount of users in a short amount of time

This is the most common reason why you will get suspended when using Follow\unfollow module. Just always use high delays between each follow\unfollow attempts, it is now automated with TweetAttacks, you don't need to wait for it to finish before you can move on, no need to rush.

### 2. Aggressive follower churn

Although twitters website says that

*Aggressive follow churn is when an account repeatedly follows and un-follows large numbers of users. This may be done to get lots of people to notice them, to circumvent a Twitter limit, or to change their follower-to-following ratio.*

Aggressive follower churn is, if you follow accountA then after few seconds you unfollow him and doing it in massive scale. In follow\unfollow module there is an option **Dont follow users that already followed before**, use it so you will not end up following the same people over and over again. You can also use the option **Unfollow users followed at least X days ago** so will not end up unfollowing the people you have just followed.

### 3. Tweets contains mainly of links

This is very self explanatory and the one that very easy to detect. If you are using @reply generator, you should mix up tweets with no links, no hashtags and no @s. If you are using **Wait and Reply** always use the normal tweets feature.

### 4. Posting many duplicate tweets across multiple accounts or single account

Using the make links unique feature in TA should help you to minimize this, and always spin {}. If you are using the same normal tweets file for many accounts, you should use **shuffle list** option in wait and reply, and use thousands of different normal tweets.

### 5. Using single IP to automate activities in multiple accounts that have traceable patterns

As much as possible, only use around 5 accounts per IP especially if you are running TA using multiple threads, for proxy recommendations always look at this KB article <http://tweetattacks.com/support/knowledgebase.php?article=10>

### 6. Sending many @mention messages in very short time span

When using that trick and you want your accounts to last longer, put minutes delay for each of the tweet you send and always use normal tweets. If you are running multiple accounts, always use proxies.

Or better, just use throw-away accounts and post as many @mention messages as you can before twitter suspend your account. I prefer this one.

7. **Creating many accounts in short time span using catch-all emails or the gmail+ emails**

If you are creating accounts using catch-all, there will be some time that twitter will learn about your activity and flag your domain, when that happens, just use other domain or use real email addresses.

8. **When many users reported your account for spam activities**

This is something that we cannot control but as much as possible, make sure that your account looks real by proving pictures of real people, using human names and not keywords and not posting too much links.

## Final Notes

There are many ways to monetize twitter traffic, you just need to test what is working for you and it will not happen in few days, and you might get some few sales but the big break not normally happening after few days. You might not get those methods at first but for sure it will be in few attempts, it's very normal to fail at first attempts. The harder it is to get something, the more valuable the rewards.

We already provided the best tool to drive thousands of traffic from twitter, now do your part and take action, monetize that traffic.

If you have questions feel free to open a support ticket here <http://tweetattacks.com/support/>

## Frequently Asked Questions

### Why not use twitter API?

There are many reasons why

1. There are many applications now that use the API and its stability is already in question
2. Its very limited
3. They can easily know and trace what you are doing if you are using API

### How to reach 2000 followers fast so I can follow more than 2000?

In twitter you can only follow more than 2000 users if you have more than 2000 followers. The fastest way to go beyond 2000 is to make sure that you follow people that will surely follow you back.

You can use this if you dont really care about the quality of followers and you just want huge list to appear authoritative.

You can also do this to just surpass 2000 easily and focus on building quality followers after reaching 2000.

There are automated tools that allow people to auto follow back user when they followed you. You just need to find them.

Like socialloomph, they have the feature to auto follow the user who followed you and that feature is enabled for most of their users.

What you can do now is use the **source** operator to search for tweet that are posted using socialloomph. If the tweet was posted using socialloomph it means that the user is a socialloomph user.

1. Switch to follow module
2. Go to <http://search.twitter.com/advanced/>

Use the **source** operator to look for users that are using bots that have auto follow back feature like socialloomph.

You can use the **source** operator to do this

example search for

a source:socialloomph

this will return tweets that contains "a" that was posted using socialloomph

Uncheck the ignore users that tweet links and no pictures

Then start following.

With this method, around 90% of those users will follow you back after few minutes.

## How Can I Transfer My License to Another Computer?

You can use the button in **Utilities->Delete License in this Computer** so you can use the license again in other computer.
